CITY OF PARKER REGULAR MEETING MINUTES HELD AT 1001 W. PARK ST, DECEMBER 17, 2024 – 5:30 PM

Mayor, Andrew Kelly called the meeting to order with invocation followed by the Pledge of Allegiance.

The following were present: Mayor, Andrew Kelly, Councilmembers Tonya Barrow, Katy Bodiford, Ron Chaple, John Haney, City Clerk Ingrid Bundy, City Planner Kevin Boyt, City Attorney Tim Sloan.

ITEMS FROM THE AUDIENCE (Non-Agenda)

Resident Christina Brinegar, of 20 Alma Avenue, expressed concerns regarding the property located 29 Alma Avenue. She also thanked Mr. Chaple for his contribution and suggested a posting of the hours of operation at the pier and park.

Resident Elizabeth Ledezma, of 18 Alma Avenue, expressed concerns regarding the property located 29 Alma Avenue.

AGENDA

Planning Board Recommendations - Parcel # 24920-010-000 - 7 Brew Coffee Variance Request

Mr. Mason Silavent, Civil Engineer, was sworn in and present to provide testimony regarding the variance request. The proposed variance is to reduce the accessory building separation from the required 10 feet to 5 feet and to increase the impervious surface ratio to 0.72 from the required 0.70. Mr. Sloan, City Attorney, administered the questions for the seven-part test; Mr. Silavent provided responses. A motion to approve the variance was made by Councilmember Barrow; seconded by Councilmember Bodiford. The motion was carried with all voting in favor; 5-0

Public Hearing, Reading and possible Adoption of Resolution 2024-403

Mr. Sloan, City Attorney, presented the details regarding Resolution 2024-403. The CBDG Grant Program requires a specific resolution relative to the City's commitment to the Americans with Disability Act. A motion to read was made by Councilmember Haney; seconded by Councilmember Bodiford. The motion was carried with all voting in favor; 5-0.

Mr. Sloan delivered the reading of Resolution 2024-403.

A motion to adopt was made by Councilmember Haney; seconded by Councilmember Chaple. The motion was carried with all voting in favor; 5-0.

Public Hearing, Reading and possible Adoption of Resolution 2024-404

Mr. Sloan, City Attorney, presented the details regarding Resolution 2024-404. The CBDG Grant Program requires a specific resolution relative to the City's adoption of policy for Equal Employment Opportunity Protection. A motion to read was made by Councilmember Bodiford; seconded by Councilmember Haney. The motion was carried with all voting in favor; 5-0.

Mr. Sloan delivered the reading of Resolution 2024-404.

A motion to adopt was made by Councilmember Bodiford; seconded by Councilmember Haney. The motion was carried with all voting in favor; 5-0.

Public Hearing, Reading and possible Adoption of Resolution 2024-405

Mr. Sloan, City Attorney, presented the details regarding Resolution 2024-405. The CBDG Grant Program requires a specific resolution relative to the City's commitment to Fair Housing. A motion to read was made by Councilmember Bodiford; seconded by Councilmember Haney. The motion was carried with all voting in favor; 5-0.

Mr. Sloan delivered the reading of Resolution 2024-405.

A motion to adopt was made by Councilmember Bodiford; seconded by Councilmember Barrow. The motion was carried with all voting in favor; 5-0.

Public Hearing, Reading and possible Adoption of Resolution 2024-406

Mr. Sloan, City Attorney, presented the details regarding Resolution 2024-406. The Resolution provides for the SRF Funding Program establishing pledges related to the application and agreement. A motion to read was made by Councilmember Barrow; seconded by Councilmember Bodiford. The motion was carried with all voting in favor; 5-0.

Resident Pat Fousek, of 1344 Stratford Avenue, had specific questions regarding the resolution and the SRF loan.

Mr. Sloan delivered the reading of Resolution 2024-406.

A motion to adopt was made by Councilmember Barrow; seconded by Councilmember Bodiford. The motion was carried with all voting in favor; 5-0.

A motion to authorize Mayor to sign was made by Councilmember Barrow; seconded by Councilmember Bodiford. The motion was carried with all voting in favor; 5-0.

DISCUSSION ITEMS BY COUNCILMEMBERS

Mayor Kelly offered to open discussion regarding the position of Police Chief for the City of Parker. Councilmember Haney expressed his support to offer Mr. Paul Baxley the position. A motion was made to select Mr. Baxley for the position of Police Chief effective January 1, 2025 by Councilmember Haney; seconded by Councilmember Barrow. The motion carried with all voting in favor; 5-0.

Councilmember Chaple shared concerns over the unkempt situation and damage incurred at the bathrooms located at the pier as well as the surrounding area. Mr. Chaple also donated to the concrete fund for the pavilion.

With no further discussion the meeting adjourned at 6:21 P.M.

Approved this day of	<u>,</u> 2025.
Andrew Kelly, Mayor	Date
Ingrid Bundy, City Clerk	Date

CITY OF PARKER

SPECIAL COUNCIL MEETING MINUTES

HELD AT 1001 W. PARK ST, DECEMBER 20, 2024 – 4:00 PM

Mayor Andrew Kelly called the meeting to order.

The following were present: Mayor, Andrew Kelly, Councilmembers Tonya Barrow, Katy Bodiford, Ron Chaple, John Haney, City Clerk Ingrid Bundy, City Attorney Tim Sloan.

AGENDA

Marriott Major Development Review

Mr. John Bianco represented the developer and presented the details of the proposed major development project. The Planning Committee recommended conditional approval with regards to utilities to the City Council. A motion was made by Councilmember Haney; seconded by Councilmember Barrow. The motion was carried with all voting in favor; 5-0.

With no further discussion the meeting adjourned at 4:15 P.M.

Approved this day of	, 2025.

CITY OF PARKER

SPECIAL COUNCIL MEETING MINUTES

HELD AT 1001 W. PARK ST, DECEMBER 20, 2024 – 5:01 PM

Mayor Andrew Kelly called the meeting to order with invocation followed by the Pledge of Allegiance.

The following were present: Mayor, Andrew Kelly, Councilmembers Tonya Barrow, Katy Bodiford, Ron Chaple, John Haney, City Clerk Ingrid Bundy, City Attorney Tim Sloan, City Accountant Suzanne Kennon.

AGENDA

FY 2024-2025 Final Budget Hearing

Ms. Suzanne Kennon, City Accountant, presented the details of the purpose for readvertisement and language requirement for the Fiscal Year 2024-2025 Budget.

Resident Pat Fousek, of 1344 Stratford Avenue, requested clarity about the reserve fund, the CRA funding, and fencing around Melendy Pond.

Resident Diane Coates, of 1521 Dover Road, expressed concerns regarding fencing around Melendy Pond.

A motion to read Resolution 2024-407 was made by Councilmember Barrow; seconded by Councilmember Bodiford. The motion was carried with all voting in favor; 5-0.

Mr. Tim Sloan, City Attorney, read the summary for Resolution 2024-407.

A motion was made to adopt Resolution 2024-407 by Councilmember Barrow; seconded by Councilmember Bodiford. The motion was carried with all voting in favor; 5-0.

With no further discussion the meeting adjourned at 5:13 P.M.

Approved this day of	, 2025.	
Andrew Kelly, Mayor	Date	
Ingrid Bundy, City Clerk	 Date	

CITY OF PARKER SPECIAL COUNCIL MEETING MINUTES HELD AT 1001 W. PARK ST, DECEMBER 27, 2024 – 10:00 AM

Mayor Andrew Kelly called the meeting to order.

The following were present: Mayor, Andrew Kelly, Councilmembers Tonya Barrow, Katy Bodiford, Ron Chaple, City Clerk Ingrid Bundy, City Attorney Tim Sloan, City Planner Kevin Boyt.

AGENDA

<u> Imminent Public Health Threat – 29 Alma Avenue</u>

Mayor Andrew Kelly presented the City's findings regarding 29 Alma Avenue. City Planner Kevin Boyt testified that the sewer is in fact capped and that the residence does not have water service.

Mr. Brandon Proteet testified that he had a lease agreement to reside at the residence executed by an individual he identified as Ms. Candace Lugo, who is not the owner of the property.

Resident Christina Brinegar, of 20 Alma Avenue, expressed concerns regarding the lease agreement that Mr. Proteet claimed to have.

Councilmember Barrow asked Mr. Proteet if he realized he cannot live in a residence without water. Mr. Proteet claimed to have paid Ms. Lugo for it to be turned on.

Resident Dave Whaley, of 45 W Cooper Drive, expressed concerns regarding the living conditions at 29 Alma Avenue.

A motion was made to abate by Councilmember Barrow; seconded by Councilmember Bodiford. The motion was carried with all voting in favor; 4-0.

Mayor Andrew Kelly advised that the residence must be vacated by 1:00 pm today, December 27, 2025.

With no further discussion the meeting adjourned at 10:21 A.M.

Approved this day of	, 2025.	
Andrew Kelly, Mayor	 Date	
Ingrid Bundy, City Clerk	 	

CITY OF PARKER REGULAR MEETING MINUTES HELD AT 1001 W. PARK ST, JANUARY 7, 2025 – 5:00 PM

Mayor Andrew Kelly called the meeting to order with invocation followed by the Pledge of Allegiance.

The following were present: Mayor, Andrew Kelly, Co Tonya Barrow, Katy Bodiford, Ron Chaple, John Haney, City Clerk Ingrid Bundy, City Planning Commission Chair Mark Rega, City Attorney Tim Sloan.

ITEMS FROM THE AUDIENCE (Non-Agenda)

Resident Pat Fousek, of 1344 Stratford Avenue, followed up on the fencing around Melendy Pond. Planning Commission Chair, Mark Rega, clarified that it was determined that a fence is not legally required based on how the State of Florida constructed the pond. Mayor Kelly concurred with Mr. Rega based on information provided by Anchor Engineering regarding the angle of inclination of the dirt.

Resident Diane Coates, of 1521 Dover Road, expressed concerns regarding fencing around Melendy Pond.

A motion to not erect a fence and leave Melendy Pond as-is was made by Councilmember Bodiford; seconded by Councilmember Barrow. The motion was carried with all voting in favor; 4-0.

AGENDA

<u>Planning Board Recommendations - Parcel # 25575-003-000 (101 Morris Drive) - Wilkins</u> With no one present to represent the applicant, the item was tabled until a future date.

<u>Planning Board Recommendations - Parcel # 24920-000-010 and Parcel # 24920-005-000 (212 Suddeth Place S) - Lozada</u>

Mr. Sloan, City Attorney, presented the details regarding the application to combine the listed parcels. The applicant, Mr. Felipe Lozada, was present to present his request. A motion to approve the application was made by Councilmember Barrow; seconded by Councilmember Chaple. The motion was carried with all voting in favor; 4-0.

Approvals for City Clerk

Mayor Kelly presented the authorization to give the new City Clerk, Ingrid Bundy, access to the bank account and provide her with a city credit card. A motion to approve the authorization was made by Councilmember Bodiford; seconded by Councilmember Barrow. The motion was carried with all voting in favor; 4-0.

DISCUSSION ITEMS BY COMMISSIONERS

Mayor Kelly presented for council consideration an applicant, Ms. Ann Elizabeth Palrang, for appointment to the unexpired vacant position on the Planning Commission for the City of Parker.

A motion was made to appoint Ms. Palrang to the position on the Planning Commission by Councilmember Barrow; seconded by Councilmember Bodiford. The motion was carried with all voting in favor; 4-0.

Councilmember Chaple expressed his desire for future discussion regarding the City of Parker to host a holiday parade.

Councilmember Barrow expressed appreciation for the new City Clerk coming on board.

Mayor Kelly introduced the new Police Chief, Paul Baxley.

With no further discussion the meeting adjourned at 5:52 P.M.

Approved this ______ day of _______, 2025.

SIGNATURE OF ARRESTA

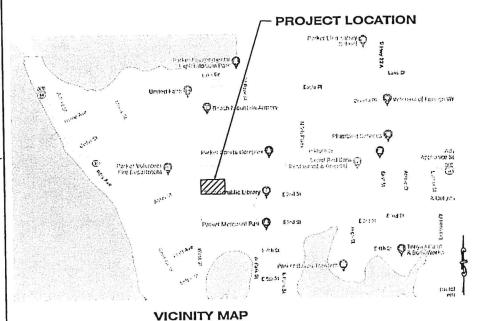

REQUIRED ATTACHMENTS

- 3 COPIES OF SITE PLANS TO INCLUDE THE FOLLOWING:
 - a. VICINITY SKETCHES SHOWING THE RELATIONSHIP OF THE SITE IN RELATION TO SURROUNDING ROADWAYS, LAND USE DISTRICTS AND FLOOD ZONES WITH BASE FLOOD ELEVATIONS.
 - b. THE BOUNDARY LINES AND DIMENSIONS OF THE AREA OR LOTS INCLUDED IN THE SITE PLAN, INCLUDING ANGLES, DIMENSIONS AND REFERENCES; A NORTH DIRECTIONAL ARROW AND MAP SCALE; AND THE PROPOSED USE OF THE LAND BY AREAS.
 - THE EXISTING AND PROPOSED GRADES, THE DRAINAGE PLAN, EROSION CONTROL PLAN AND THE PROPOSED STRUCTURES WITH APPROPRIATE TOPOGRAPHIC CONTOUR INTERVALS OR SPOT ELEVATIONS.
 - d. THE SHAPE, SIZE AND-LOCATIONS OF ALL STRUCTURES, INCLUDING THE FLOOR AREA AND ELEVATIONS THEREOF; THE FLOOR AREA AND GROUND COVERAGE RATIOS AND THE RELATIVE FINISHED GROUND AND BASEMENT FLOOR GRADES.
 - e. NATURAL FEATURES SUCH AS WETLANDS, SHORELINE, LAKES OR PONDS AND PROTECTED TREES AND MAN-MADE FEATURES SUCH AS EXISTING ROADS, SIDEWALKS, WALLS, FENCES OR OTHER STRUCTURES INDICATING WHICH ARE TO BE RETAINED, REMOVED OR ALTERED AND THE ADJACENT PROPERTIES THEIR USES AND LAND USE DESIGNATIONS.
- f. PROPOSE STREETS, DRIVEWAYS, SIDEWALKS AND PARKING FACILITIES, VEHICULAR TURNAROUNDS, CURB CUTOUTS AND LOADING AREAS; THE LOCATION OF SOLID WASTE RECEPTACLES, THE INSIDE RADII OF ALL CURVES, THE WIDTH OF THE STREETS, DRIVEWAYS AND SIDEWALKS AND TOTAL NUMBER OF AVAILABLE PARKING SPACES SPECIFYING THE TYPE OF CONSTRUCTION AND CRITICAL DIMENSIONS AND THE OWNERSHIP OF THE VARIOUS FACILITIES.
- g. THE SIZE AND LOCATION OF ALL EXISTING AND PROPOSED PUBLIC AND PRIVATE UTILITIES AND EASEMENTS; WATER AND SEWER TAP LOCATIONS; SEWER CLEANOUTS AND TURNS; AND WATER, METER TYPES, SIZES AND LOCATIONS.
- h. ALL PROPOSED LANDSCAPING AND THE DIMENSIONS AND LOCATION OF ALL PROPOSED SIGNS.
- 2. FLOOD ZONE ELEVATION CERTIFICATE
- 3. CITY PERMIT SIGN APPLICATION IF APPROPRIATE.
- 4. ALL APPLICABLE STATE AND FEDERAL PERMITS. (DEP. DOT ETC.)
- 5. ALL UTILITY FEES MUST BE PAID IN FULL PRIOR TO THE DEVELOPMENT PERMIT BEING ISSUED.

GENERAL NOTES

- Existing conditions and utilities shown are from field observations at the time of survey and available records. No guarantee is made that other underground utilities do not exist.
- The Contractor shall be responsible for contacting the appropriate municipal authorities and utility companies to obtain their assistance in locating
 underground utilities. The Contractor shall be responsible for the protection of all utilities throughout the construction period. The costs for repairing
 utilities domaged by construction activities shall be the responsibility of the Contractor.
- 3. The Contractor shall comply with local, state, and federal regulations. An NPDES permit will be obtained by the Owner. The permit shall be posted at the construction entrance. All other permits and licenses required for the construction activities shall be the responsibility of the Contractor.
- 4. The Contractor shall be responsible for construction stake out and field engineering.
- The Contractor shall protect existing control points and benchmarks, whether public or private. The owners of control points and benchmarks that will be disturbed by construction activities shall be contacted prior to disturbance of the markers.
- Traffic control devices shall be installed and maintained in occordance with Florida Department of Transportation specifications and the "Manual on Uniform Traffic Control Devices."
- 7. The Contractor shall be responsible for the repair of any roadways or haul routes damaged by construction operations.
- Prior to beginning earthwork operations, the site grading area shall be cleared and grubbed and stripped of any topsoil. Any topsoil shall be stockpiled on site to be reused in landscaped areas, and/or areas outside povements and building structures.
- Debris from clearing and grubbing operations may be utilized for erasion control, and shall be removed from the project site and legally disposed of by the Contractor. Burning on site will not be allowed without approval and permits from all authorities having jurisdiction.
- 10. All debris and organic materials shall be removed from areas receiving fill and the owner's engineer shall be notified before beginning any backfill operations. An inspection shall be performed to determine stability of existing material. Should un-suitable material be encountered, the contractor shall remove some, at the direction of the engineer, and replace with embankment material. Fill material shall be suitable on-site material or a locally approved mixture suitable for structural fill. Embankment fill shall be accomplished in little of 8 inch maximum compacted thickness. Each lift shall be compacted to a minimum of 98% Standard Proctor Density (ASTM D698). The top 6" layer of fill in structural areas, and the top 6" of sub-grade in cut areas shall be processed and compacted to 100% Standard Proctor Density (ASTM D698).
- 11. The Contractor shall employ an approved independent testing laboratory approved by the Owner's representative to perform density tests.

 Testing will be required as follows:

 A. test every 700 S.Y. per lift of fill, subgrade, and base processed or placed.

 B. There shall be no subsequent layers placed before the underlying layer has all passing density tests.

 Test locations shall be approved by the Owner's Representative and a City of Parker representative must be present for all tests within public right of ways or as required for building permit approval.
- 13. Concrete shall develop a minimum 28-day compressive strength of 3,000 psi unless noted otherwise.
- 14. Pipe bedding and installation shall be in accordance with the minimum recommendations of the supplier and shall meet City of Parker's requirements. Pipe trenches shall be backfilled and properly compacted so that excessive trench settlement does not occur.
- 15. The Contractor shall be responsible for compliance with all OSHA guidelines and regulations.
- 16. The utility Contractor shall notify the City of Parker water and sewer departments of the start date of construction and schedule a pre-construction meeting to discuss potential conflicts and verify compliance with material standards and installations.
- 17. The final grades of all appurtenances, Le. manholes, valve boxes, cleanouts, etc., shall be adjusted to match final grades.
- 18. The City of Parker shall be notified prior to beginning work. The contractor shall secure city approval and schedule work before making tops on existing lines or working around existing utilities.
- 19. The contractor is responsible for all drainage and erasion control during construction.
- 20. In all landscoping areas and curbed islands, the site contractor shall provide a minimum topsoil thickness of 2 feet.
- 21. The Developer shall be responsible for the relocation of any conflicting utilities within or related to the development of this properly.
- 22. It is the contractor's responsibility to restrict public access to this site during construction.
- 23. The Contractor shall notify the City of Parker water department concerning the temporary use of water in the development during construction. Any use of water from the City of Parker system must be regulated and billed either through a meter set installed by the City of Parker or from a fire hydrant whose usage has been granted by the City of Parker and its procedures and billings are followed by the contractor.
- 24. The sile contractor shall refer to architectural plans furnished by the owner for dimensions of the building, and shall coordinate and verify layout
- 25. The site will be maintained in accordance with rules and regulations set by FDOT, Bay County, the City of Parker, and not create a public safety hazard or nulsance to the City of Parker.

LEGAL DESCRIPTION

A lot or parcel of land being located in the City of Parker, Bay County, Florida, and being more particularly described as follows:

described as follows:

BECRANNO at the intersection of the South Right of Way (R/M) of East U.S. Highway 98 (70° R/M) with the East R/M of West Street (50° R/M) as marked by an existing iran pin (EP) (5/6° Reba); therea along sold South R/M bearing 5 8931'10° E a distance of 173.12 FT to an EP (1° Pips); therea along sold Morth R/M bearing 8 8933'50° E a distance of 193.88 FT to an EP (1° Pips); therea depart sold South R/M bearing 8 0028'55° W a distance of 193.51 FT to an EP (1° Right); therea 50023'54° W a distance of 173.99 FT to the Morth R/M of East 2nd Street (50° R/M) as marked by an DP (1° Pips); therea deaps sold North R/M is East R/M bearing N 8039'00° W a distance of 371.35 FT to sold East R/W as marked by an EP (lings)*4; therea doing sold East R/M bearing N 0029'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M bearing N 0029'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M bearing N 0729'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M bearing N 0729'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M bearing N 0729'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M bearing N 0729'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M bearing N 0729'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M bearing N 0729'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M bearing N 0729'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M on marked by an EP (SP); therea SOUTS STAN 0729'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M on marked by an EP (SP); therea SOUTS STAN 0729'02° E a distance of 173.00 FT to a set from the (SP); therea doing sold East R/M on marked by an EP (SP); therea doing sold East R/M on marked by an EP (SP); therea SOUTS STAN 0729'02° E a distance of 173.00 FT to a set from the East

NOVA Project Number 10111-2023184

Dear Mr. Parish:

NOVA Engineering and Environmental, LLC (NOVA) has completed the authorized Geotechnical Engineering Report for the developemnt in Parker, Bay County, Florida. The work was performed in general accordance with NOVA Proposal Number 10111-2023184, dated August 31, 2023. This report briefly discusses our understanding of the project at the time of the subsurface exploration, describes the geotechnical consulting services provided by NOVA, and presents our findings, conclusions, and recommendations.

We appreciate your selection of NOVA and the opportunity to be of service on this project. If you have any questions, or if we may be of further assistance, please do not hesitate to contact us.

Sincerely.

1.0 INTRODUCTION

This section provides information relating to our contract, the purpose of our work, and a summary of our understanding of the project,

1.1 NAME AND LOCATION OF PROJECT

The ± 2.6 -acre Subject Property (Bay County Parcel Numbers 5870-000-000, 25869-000-000 and 25838-000-000) is located at 909 West Street in Parker, Bay County, Florida. The location of the site is indicated on the Site Location Map included in Appendix A.

1.2 AUTHORIZATION AND SCOPE OF STUDY

Our work on this project was as described in our Proposal Number 10111-2023184, dated August 31, 2023, and authorized by the Client on September 5, 2023. The primary objectives of this work were to perform a geotechnical exploration within the areas of the proposed construction and to assess these findings as they relate to geotechnical aspects of the planned site development. The authorized geotechnical engineering services included a site reconnaissance, soil test borings and sampling, engineering evaluation of the field and laboratory data, and the preparation of this report. As authorized per the above referenced proposal, this completed geotechnical report includes:

- ➤ A description of the site, fieldwork, laboratory testing and general soil conditions encountered, together with a Boring Location Plan and individual Test Boring Records.
- > Site preparation considerations that include geotechnical discussions regarding site stripping and subgrade preparation and engineered fill/backfill placement.
- > Recommendations for controlling groundwater and/or run-off during construction.
- > Foundation system recommendations for the proposed structure, as deemed necessary based on the boring results.
- > Slab-on-grade construction considerations based on the geotechnical findings, including the need for a sub-slab vapor barrier or a capillary barrier.
- > Suitability of on-site soils for re-use as structural fill and backfill. Additionally, the criteria for suitable fill materials will be provided.
- > Recommended quality control measures (i.e., sampling, testing, and inspection requirements) for site grading and foundation construction.
- Recommended pavement sections based on assumed traffic loading and subgrade strengths estimate from correlation with test borings, laboratory data, and soil types collected from the test borings.

Recommended soil related design parameters for the SMS area including measured hydraulic conductivity rates and an estimated fillable porosity value.

The assessment of the presence of wetlands, floodplains, or water classified as state waters was beyond the scope of this exploration. Additionally, the assessment of site environmental conditions, including the detection of pollutants in the soil, rock, or groundwater, at the site was also beyond the scope of this geotechnical exploration and evaluation.

2.0 PROJECT INFORMATION

Our understanding of this project is based on discussions with The Client, review of the provided site plans with requested boring locations, a site reconnaissance during boring layout and field testing, and our experience with similar projects.

2.1 Site Plans and Documents

We were furnished with the following document:

Document: Boring Markers/Site Construction Plans for All Metal Roofing and Siding Dated: February 2023

Created By: Northstar Engineering Services, LLC.

Note: Boring locations and depths were provided by the Client.

2.2 PROJECT SITE

The ±2.6-acre Subject Property (Bay County Parcel Numbers 5870-000-000, 25869-000-000 and 25838-000-000) is located at 909 West Street in Parker, Bay County, Florida. At the time of our field exploration, the vicinity of the Subject Property was observed to be moderately developed with existing medium-sized commercial warehouse structures and a graveyard to the west, a church and a single family residence located to the east and undeveloped lots of similar size to the north and south. Parker Bayou is located about 900 feet south of the Subject Property. We note that the Subject Property was previously developed with a single-story structure and paved areas that had been demolished prior to our exploration.

2.3 PROPOSED DEVELOPMENT

NOVA understands the project will include the construction of a single-story, commercial warehouse structure with a plan footprint of approximately 28,000 square feet with associated asphaltic and concrete pavements and a stormwater management system (SMS) consisting of a conventional shallow dry retention pond.

The warehouse structure is anticipated to be of metal frame construction supported by a shallow foundation system.

Maximium Loads

Final structural loading details were not available from the Design Team at the time of the issuance of this report. We have therefore assumed that maximum loadings for the proposed structure will not exceed 75 kips per column for isolated interior columns and 8 kips per linear foot for continuous load bearing walls.

Site Grading

Final grading details were not available from the Design Team at the time of the issuance of this report. We have therefore assumed that finished site grades will not change greater than +/- 3 feet from existing grades within the proposed structure footprint.

3.0 SUBSURFACE EXPLORATION

3.1 AREA GEOLOGY

According to the United States Geological Survey (USGS), the subject site is located in Bay County within the Gulf Coastal Plain, separated from the Florida Platform by geologic structures known as the Gulf Trough and Apalachicola Embayment. These structures formed a bathymetric and environmental barrier from the earliest Eocene or earliest Oligocene periods into the Miocene. According to the "Text to Accompany the Geologic Map of Florida" by Scott, 2001, the site is generally underlain by undifferentiated sediments deposited during the Quaternary period. These sediments typically consist of siliciclastics (sand), organics and freshwater carbonates. These soils are highly permeable and form the Sand and Gravel Aquifer of the surficial aquifer system. Surficial soils in the region are primarily siliciclastic sediments deposited in response to the renewed uplift and erosion in the Appalachian highlands to the north and sea-level fluctuations. The extent and type of deposit is influenced by numerous factors, including mineral composition of the parent rock and meteorological events.

NRCS Soil Survey

The Natural Resources Conservation Service (NRCS) "Web Soil" was reviewed to obtain shallow soil and seasonal high-water table (SHWT) information. Generally, the site lies within the Lakeland sand (Map Unit 9) unit. The NRCS Soil Survey map and data have been included in the Appendix.

Unit no.	Soil Name	Depth (in)	Soil Description	Depth to Seasonal High Groundwater (in)
9	Lakeland Sand 0 to 5 Percent Slopes	0 - 80	Sand	More than 80

3.2 LOCAL EXPERIENCE

NOVA has conducted numerous geotechnical studies for projects in the general site area. The typical subsurface conditions in this area were found to consist of fine-grained sands to silty sands (USCS classifications of SP, SP-SM, and SM). In some instances, sand to silty sand strata with some organics and/or significant organic staining have also been encountered.

3.3 FIELD EXPLORATION

Our field exploration was conducted on September 22 and October 3, 2023, and included:

- ➤ Four 15-foot-SPT borings at locations provided by the Client (designated B-1 through B-4 in the attached Appendix).
- > Two 10-foot-auger borings at locations provided by the Client (designated S-1 and S-2).
- > One Double Ring Infiltration (DRI) test at a location provided by the Client.

The boring and test locations were established in the field by NOVA personnel using a handheld GPS device and by estimating distances and angles from site landmarks. Prior to initiating field testing, underground utilities were marked by the state utility locate service (811, or Sunshine One-Call). Any required underground utility related adjustments of the test locations were then made at the time of the field exploration. The approximate test locations are shown on the Boring Location Plan presented in Appendix B. If increased accuracy is desired by the Client, test locations and elevations may be surveyed.

The Test Boring Records in Appendix B show the Standard Penetration Test (SPT) resistances, or "N-values", and present the soil conditions encountered in the borings. These records represent our interpretation of the subsurface conditions based on the field exploration data, visual examination of the split-barrel samples, laboratory test data, and generally accepted geotechnical engineering practices. The stratification lines and depth designations represent approximate boundaries between various subsurface strata. Actual transitions between materials may be gradual.

The groundwater levels reported on the Test Boring Records represent measurements made at the completion of each test boring, following a suitable stabilization period. The test borings were subsequently backfilled with soil cuttings from the drilling process for safety concerns.

SPT Borings

The test borings were performed using the guidelines of ASTM Designation D-1586, "Penetration Test and Split-Barrel Sampling of Soils". A mud rotary drilling process was used to advance the borings once groundwater was encountered. At regular intervals, soil samples were obtained with a standard 1.4-inch I.D., 2.0-inch O.D., split-tube sampler. The sampler was first seated six inches and then driven an additional foot with blows of a 140-pound hammer falling 30 inches. The number of hammer blows required to drive the sampler the final foot is designated the "Penetration Resistance". Representative portions of the soil samples, obtained from the sampler, were placed

in sealed containers and transported to our laboratory for further evaluation and laboratory testing.

Auger Borings

The auger borings were performed using a hand operated soil sampler. Soil samples were obtained from the auger bucket approximately at each stratum break.

Test Boring Records in Appendix B present the soil conditions encountered in the borings. These records represent our interpretation of the subsurface conditions based on the field exploration data, visual examination of the recovered samples, laboratory test data, and generally accepted geotechnical engineering practices. The stratification lines and depth designations represent approximate boundaries between various subsurface strata. Actual transitions between materials may be gradual.

3.4 LABORATORY TESTING

Following completion of the field work, soil samples obtained in the field were returned to our office for classification and laboratory testing assignment. These tests included the following:

- Manual/Visual Soil Classification
- Moisture Content
- > Fines Content
- Organic Content
- Re-Molded Falling Head Permeability

The purpose of the testing program was to classify the subsurface materials relative to the Unified Classification System and to determine their physical characteristics including strength, and compressibility.

Moisture Content

The moisture content is the ratio expressed as a percentage of the weight of water in a given mass of soil to the weight of the solid particles. This testing was conducted in general accordance with ASTM Designation D-2216. Seven moisture content tests were performed in this study.

Fines Content

The percentage of fines passing through the No. 200 sieve is generally considered to represent the amount of silt and clay of the tested soil sample. The sieve analysis testing

was conducted in general accordance with ASTM Designations D-6913 and D-1140. Seven fines content tests were performed in this study.

Organic Content

The organic content is the ratio expressed as a percentage of the weight of organic material in a given mass of soil to the weight of the solid particles. This testing was conducted in general accordance with ASTM D-2974. Seven organic content tests were performed in this study.

Re-Molded Falling Head Permeability

A remolded falling head permeability test (ASTM D-5084) is a common laboratory test used to determine the hydraulic conductivity of fine-grained soils. The test involves the flow of water through a re-molded, fully saturated soil sample inside a rigid-wall permeameter connected to a standpipe of constant diameter. Before beginning the flow measurements, the soil sample is saturated, and the standpipe is filled with water to a given level. The test then starts by allowing the water to flow through the sample until the water in the standpipe reaches a lower limit. The time required for the water to flow from the upper to lower limit is recorded. One remolded permeability test was performed in this study.

Detailed descriptions of the tests conducted are presented in Appendix C. The soil samples will be discarded 30 days following the submittal of this report, unless you request otherwise.

3.5 SUBSURFACE CONDITIONS

The following paragraphs provide generalized descriptions of the subsurface profiles and soil conditions encountered by the borings conducted during this exploration.

Surface Materials

Surface materials encountered in test borings generally consisted of sand with trace organics and building debris (from the recently demolished building). Further, existing asphaltic pavement occupies part of the subject property.

Fill

Based on the boring results and our observations of the property at the time of our field exploration, previously installed fill materials do not appear to be present on this property.

Native Soils

The soil borings generally encountered very loose to medium-dense fine-grained sands (USCS classification of SP) below surficial materials to about 12 feet below existing grade (BEG), underlain by medium dense fine-grained slightly clayey to clayey sands (SP-SC, SC) to the maximum explored depth of about 15 feet BEG.

Standard Penetration Test (SPT) resistance values ("N"- values) varied from 2 to 16 blows per foot (bpf) and generally increased with depth. SPT values typically ranged from 2 to 8 bpf in the upper 10 feet of the soil horizon, and 11 to 16 bpf at greater depths.

Groundwater Conditions

Groundwater in the Bay County, Florida area typically occurs as an unconfined aquifer condition. Consequently, the groundwater table is expected to be a subdued replica of the original surface topography.

Recharge is provided by the infiltration of rainfall and surface water through the soil overburden. More permeable zones in the soil matrix can affect groundwater conditions.

A stabilized groundwater table was not encountered in the test borings at the time of our final field exploration, which occurred during a period of relatively normal seasonal rainfall and within a pattern of frequent (daily) rain events. Based on a review of topographic maps and our visual site observations, we anticipate the groundwater flow at the site to be towards the south (i.e., towards nearby Parker Bayou).

Groundwater levels vary with changes in season and rainfall, construction activity, surface water runoff, and other site-specific factors. Groundwater levels in the Bay County area are typically lowest in the late fall to winter and highest in the early spring to mid-summer with annual groundwater fluctuations by seasonal rainfall; consequently, the water table may vary at times. Based on comparisons of current annual monthly rainfall data to historical rainfall data extending back 50+ years in time and the boring results, we estimate that the normal permanent seasonal high groundwater (SHGW) elevation will remain at a depth below 15 feet BEG, during the wet season. This data generally correlates to the values provided by the USGS Natural Resources Conservation Service (NRCS). The following table shows the following information for each soil test boring: soil type per NRCS, the encountered groundwater table and the estimated seasonal high groundwater level.

Test Boring	Soil Type*	Encountered Groundwater Depth (ft)**	Estimated Seasonal High Groundwater Depth (ft)**
B-1	Sand	Not Encountered	Below 15 feet
B-2	Sand	Not Encountered	Below 15 feet
B-3	Sand	Not Encountered	Below 15 feet
B-4	Sand	Not Encountered	Below 15 feet
S-1	Sand	Not Encountered	Below 15 feet
S-2	Sand	Not Encountered	Below 15 feet

^{*} Based on the NRCS Soil Survey provided Appendix A

^{**} From the existing ground surface

4.0 GEOTECHNICAL ASSESSMENT

The following assessment is based on our understanding of the proposed construction, our site observations, our evaluation and interpretation of the field data obtained during this exploration, our experience with similar subsurface conditions, and generally accepted geotechnical engineering principles and practices.

Based on boring data and analysis, the subject site appears to be favorable for the proposed development. On-site near surface soils that are categorized as fine-grained sands (SP) based on the Unified Soil Classification System (USCS) are considered suitable for reuse as structural fill or backfill (if required), provided that the materials are free of building debris, rubble, clay, rock, roots, and organics.

We note that subsurface conditions in unexplored locations can and will vary from those encountered at the boring locations considered and discussed herein. If such variations are noted during construction, or if project development plans are changed, we request the opportunity to review the changes and amend our recommendations, if necessary.

The following sections present our recommendations for site preparation and grading, and for the design of foundations.

5.0 RECOMMENDATIONS

5.1 SITE PREPARATION

Prior to proceeding with construction, all topsoil and vegetation, trees and associated root systems, and any other deleterious non-soil materials found to be present should be stripped from the proposed construction areas. Clean topsoil may be stockpiled and subsequently re-used in landscaped areas. Debris-laden materials should be excavated, transported, and disposed of off-site in accordance with appropriate solid waste rules and regulations. Any existing utility locations should be reviewed to assess their impact on the proposed construction and relocated/grouted in-place as appropriate.

Prior to fill placement or construction within cut areas, we recommend densifying (compacting) the upper zone of fine-grained sand (SP, N-values of concern varying between 2 and 6) that were generally encountered in the upper 2 feet to 6 feet of the soil horizon all SPT borings performed for this project.

This can most likely be accomplished by compacting the exposed subgrade from the stripped grade elevation with a heavy weight vibratory roller (i.e., a minimum 10-ton roller, static weight, with a minimum 5-foot drum diameter) to a minimum soil density of at least 98 percent of the maximum dry density as determined by the Modified Proctor test method (ASTM D-1557), as equipment of this size can typically impact sandy profiles to depths of 5+ feet. We note that vibratory compaction operations should not be conducted within a clear distance of 50 feet from any existing structures on adjacent properties.

Verification of the improvement of the loose subgrade soils within the proposed structure footprints that are at grade should be achieved via Dynamic Cone Penetrometer testing to a depth of at least 4 feet BEG and additional recommendations (i.e., further compaction effort, possible undercutting, choking stone into the exposed subgrade, etc.) can be rendered in the field as these tests are performed.

NOVA should observe the compaction of the subgrade to locate soft, weak, or excessively wet fill or existing soils present at the time of construction. Any unstable materials observed during the evaluation and compaction operations should be undercut and replaced with structural fill or stabilized in-place by scarifying and re-densifying. Actual remedial recommendations can best be determined by the geotechnical engineer in the field at the time of construction.

5.2 EXCAVATION

Excavations greater than five feet deep (such as for deeper foundations and underground utilities) should be sloped or shored in accordance with local, state, and federal regulations, including OSHA (29CFR Part 1926), excavation safety standards. It should be noted that the Contractor is solely responsible for site safety. This information is provided only as a service and under no circumstances should NOVA be assumed to be responsible for construction site safety. Each excavation should be observed and classified by an OSHA-competent person. All excavations below the groundwater level are classified as OSHA Class C soils for excavation purposes.

After stripping and trench excavation, a NOVA geotechnical engineer should carefully evaluate the exposed soils. We recommend undercutting the proposed pipe trench areas approximately ½ feet below the proposed pipe bearing elevations and installing structural backfill for use as pipe bedding materials. Sewer pipe installation should be constructed in general compliance with ASTM D 2321, standard practice for underground installation of pipe for sewers and other gravity flow applications.

Groundwater Control

A stabilized groundwater table was not encountered in the test borings during of our field exploration, which occurred during a period of relatively normal seasonal rainfall and within a period of frequent (daily) rain events. Based on our understanding of the proposed construction, we do not anticipate that significant groundwater control issues will develop during mass grading and foundation construction.

5.3 FILL PLACEMENT

Fill Suitability

Fill materials should be relatively clean sands with less than 12 percent fines (material passing the No. 200 sieve), and free of non-soil materials and rock fragments larger than 3 inches in diameter. Based on visual examination and limited laboratory soil testing results, the existing surficial soils encountered during this exploration typically consisted of fine-grained sands (SP) that should be suitable for re-use as fill or backfill material, provided they are within acceptable moisture tolerances at the time of replacement and compaction.

We recommend that stockpiles of all materials planned for re-use be sealed as they are excavated to prevent (to the greatest extent practical) the intrusion of moisture into the core of the soil stockpile(s) during significant rain events prior to their potential re-use as fill and/or backfill soils.

Prior to construction, bulk samples of all proposed fill materials (both native and import) should be laboratory tested to confirm their suitability. Organic and/or debrisladen material is not suitable for re-use as structural fill. Topsoil, mulch, and similar organic materials can be wasted in architectural areas. Debris-laden materials should be excavated, transported, and disposed of off-site in accordance with appropriate solid waste rules and regulations.

Soil Compaction

Fill should be placed in thin, horizontal loose lifts (maximum 8-inch) and compacted to a minimum soil density of at least 95 percent of the Modified Proctor maximum dry density (ASTM D-1557). The upper 12 inches of soil beneath the bottoms of all foundation footings should be compacted to at least 98 percent. In confined areas, such as utility trenches, portable compaction equipment and thinner fill lifts (3 to 4 inches) may be necessary.

Fill materials used in structural areas should have a target maximum dry density of at least 95 pounds per cubic foot (pcf). If lighter weight fill materials are used, the NOVA geotechnical engineer should be consulted to assess the impact on design recommendations.

Soil moisture content should be maintained within 3 percent of the optimum moisture content. We recommend that the grading contractor have equipment on site during earthwork for both drying and wetting fill soils. Moisture control may be difficult during rainy weather. Soils excavated from below the groundwater table will likely require significant efforts to achieve acceptable moisture contents prior to re-use as fill.

One test per 2,500 square feet of building footprint and per 5,000 square feet of pavement area should be performed at the stripped grade elevation and in each lift of fill, with test locations well distributed throughout the fill mass. When filling in small areas, at least one test per day per area should be performed. One test in conventional spread foundations, one test per in each column footing, and one test per 50 linear feet of continuous strip foundations is also recommended.

The site should be graded during construction to maintain positive drainage away from the construction areas, to prevent ponding of stormwater on the site during and shortly following significant rain events. The construction areas should be sealed and crowned with a smooth roller to minimize ponding water from storm events at the end of each day of work.

5.4 FOUNDATIONS

General

We understand that the proposed structure will be supported on a conventional shallow foundation system. Final structural loadings were not available from the design team at the time of the issuance of this report; we have therefore assumed that maximum isolated interior column and continuous load bearing wall loads will not exceed 75 kips per column and 8 kips per linear foot, respectively, for the proposed structure.

If any of the above stated design assumptions are found to be incorrect or are revised, NOVA should be contacted immediately so that additional analyses can be performed to determine if the recommendations presented herein will need to be modified.

Shallow Foundations

Design: After the recommended site and subgrade preparation and fill placement has been completed, it is our opinion that a conventional shallow foundation consisting of isolated spread footings and/or turn-down slab-on-grade construction can be used to support the proposed structure.

Foundations bearing on densified existing soils and/or compacted structural fill, as recommended in this report, may be designed employing a maximum allowable soil bearing pressure of 1,500 pounds per square foot (psf).

We recommend a value of 0.35 can be employed as the coefficient of friction (sliding resistance) between foundations and the underlying residual or fill soils. Footings should be a minimum of 24 inches in width for ease of construction and to reduce the possibility of localized shear failures. Isolated exterior and interior footing bottoms should be established at least 18 inches below finished surrounding exterior grades. When utilizing a post-tensioned monolithic slab-on-grade design, exterior and interior footing bottoms should be established a minimum of 12 inches below adjacent finished grades.

Settlement: Settlements for a spread foundation bearing on structural fill were assessed using SPT values to estimate elastic modulus, based on published correlations and previous NOVA experience. We note that the settlements presented are based on the SPT boring results. Conditions may be better or worse in other areas; however, we believe the estimated settlements are reasonably conservative.

Based on the provided structural loadings, the soil bearing capacity provided above, the presumed foundation elevations as discussed above, we expect residual primary total settlement beneath individual foundations to be on the order of 1-inch.

The amount of differential settlement is difficult to predict because the subsurface and foundation loading conditions can vary considerably across the site. However, we anticipate residual differential settlement between adjacent foundations will be less than $\frac{1}{2}$ inch. The final deflected shape of the structure will be dependent on actual foundation locations and loading.

Foundation support conditions are highly erratic and may vary dramatically in short horizontal distances. It is anticipated that the geotechnical engineer may recommend a different bearing capacity upon examination of the actual foundation subgrade at numerous locations.

To reduce the differential settlement if lower consistency materials are encountered, a lower bearing capacity should be used. We anticipate that timely communication between the geotechnical engineer and the structural engineer, as well as other design and construction team members, will be required.

Construction: Foundation excavations should be evaluated by the NOVA geotechnical engineer prior to reinforcing steel placement to observe foundation subgrade preparation and confirm bearing pressure capacity. Foundation excavations should be level and free of debris, ponded water, mud, and loose, frozen, or water-softened soils. Concrete should be placed as soon as is practical after the foundation is excavated and the subgrade evaluated. Foundation concrete should not be placed on frozen or saturated soil.

If a foundation excavation remains open overnight, or if rain or snow is imminent, a 3 to 4-inch thick "mud mat" of lean concrete should be placed in the bottom of the excavation to protect the bearing soils until reinforcing steel and concrete can be placed.

5.5 SLAB-ON-GRADE

General

The conditions exposed at subgrade levels will vary across the site and may include structural fill or densified in-situ soils. The slab-on-grade may be adequately supported on these subgrade conditions subject to the recommendations in this report. The slab-on-grade should be jointed around columns and along walls to reduce cracking due to differential movement. An underdrain system is not necessary beneath the slab, provided that the slab is installed at least 2 feet above the post development high groundwater level. An impermeable vapor barrier is recommended beneath finished spaces to reduce dampness.

Once grading is completed, the subgrade can be exposed to adverse construction activities and weather conditions during the period of sub-slab utility installation. The subgrade should be well drained to prevent the accumulation of water. If the exposed subgrade becomes unstable, excessively wet or exhibits excessive rutting or pumping, the geotechnical engineer should be consulted.

Subgrade Modulus

A coefficient of subgrade reaction (k) of 125 pci (psi per inch) may be used for conventional slab design where slabs bear upon subgrades prepared in accordance with previous recommendations.

Please note that this magnitude of k is intended to reflect the elastic response of soil beneath a typical floor slab under light loads with a small load contact area often measured in square inches, such as loads from forklifts, automobile/truck traffic or lightly loaded storage racks. The recommended coefficient of subgrade reaction (k) of 125 pci is not applicable for heavy slab loads caused by bulk storage or tall storage racks, or for mat foundation design.

Several design methods are applicable for conventional slab design. We have assumed that the slab designer will utilize the methods discussed in the American Concrete Institute (ACI) Committee 360 report, "Guide to Design of Slabs-on-Ground, (ACI 360R-10).

5.6 STORMWATER MANAGEMENT SYSTEM RECOMMENDATIONS

NOVA understands that the stormwater management system (SMS) to treat and dispose of stormwater runoff associated with the proposed development is desired to consist of a conventional shallow dry retention basin. Based on the results of our field exploration, the subsurface conditions encountered in the SMS area appear to be adaptable for the treatment and disposal of stormwater runoff via the desired conventional shallow retention basin. We recommend that the soil parameters presented in the table on the next page be considered for the design of the SMS for this project.

SMS SOIL DESIGN PARAMETERS									
Corresponding Soil Boring Test Location	S-1, S-2, and B-2								
Approximate Depth to Confining Stratum, BEG**	Below 15 feet								
Measured Vertical Hydraulic Conductivity (k _v)*	7 ft/day								
Estimated Lateral Saturated Hydraulic Conductivity (kh)*	10 ft/day								
Measured In-Situ Infiltration Rate (DRI)	15 in/hr.*								
Estimated Fillable Porosity of Soil	20%								
Average Depth to Stabilized Groundwater Table, BEG	Not Encountered								
Estimated Average Normal Permanent SHGW Table, BEG**	Below 15 feet								

^{*} Factors of Safety have not been applied to the noted hydraulic conductivity and infiltration values.

The estimated normal permanent SHGW level provided in Table 1 above is based on our experience with projects in this locale; the soil strata encountered in the test boring; and the published information by the "Web Soil Survey" National database, NRCS division of the United States Department of Agriculture (USDA).

5.7 PAVEMENT CROSS SECTION DESIGN

General

A recommended flexible (asphalt) pavement section has been developed for this project based on our understanding of the existing subsurface conditions, review of applicable FDOT specifications, and the <u>assumed</u> loading conditions of 50,000 Equivalent Single-Axle Loads (ESALS) for heavy duty pavement areas and 25,000 Equivalent Single-Axle Loads (ESALS) for standard (light) duty pavement areas, with a 20-year design life. The terminal serviceability index and reliability for these pavement sections were assumed to be 2.0 and 85%, respectively. Traffic exceeding the stated criteria will require a heavier pavement section.

Flexible Pavements

We recommend a minimum compaction of at least 98 percent of the maximum dry density be specified for the base and stabilized subgrade courses as determined by the Modified Proctor test method (ASTM D-1557). A minimum separation of at least 24 inches between the bottom of an FDOT approved Crushed Limerock Base or GAB course and the seasonal high groundwater table should be maintained.

^{**}Relative to the maximum explored depth in test borings.

All asphalt material and paving operations should meet applicable specifications of the Asphalt Institute and FDOT requirements. A NOVA technician should observe placement and perform density testing of the stabilized subgrade and base course materials as well as asphalt. We recommend using the parameters shown for a flexible pavement section presented below in Table 1 (Standard Duty) and in Table 2 (Heavy Duty) for the flexible pavement section designs for this project.

Table 1 - Recommended Standard Duty Flexible Pavement Section								
Asphaltic Concrete Structural Course (SuperPave SP-9.5 or SP-12.5)								
FDOT Approved Crushed Limerock, Crushed Concrete, or Graded Aggregate Base (GAB) Material (minimum LBR of 100)	6 inches							
Stabilized Subgrade Course (minimum LBR of 40)	12 inches							

Table 2 – Recommended Heavy Duty Flexible Pavement Section (Primary Entrance, and areas where static wheel turning is required)								
Asphaltic Concrete Surface Course (such as a 9.5 mm SuperPave approved FDOT mix)	1 inch							
Asphaltic Concrete Structural Course (such as a 12.5 mm SuperPave approved FDOT mix)	1½ inches							
FDOT Approved Crushed Limerock, Crushed Concrete, or Graded Aggregate Base (GAB) Material (minimum LBR of 100)	8 inches							
Stabilized Subgrade Course (minimum LBR of 40)	12 inches							

Based on visual classification of the near-surface materials encountered in the test borings, it appears that the native sand (SP) soils will likely not meet the minimum LBR requirement of 40 for the Stabilized Subgrade Course (SSC, which is the upper 12 inches of subgrade beneath flexible pavement sections) and will require stabilization with soil fines or additional base course material. An imported material having a minimum LBR value of 40 should be specified for the final (12-inch) lift of fill for pavement areas being installed over fill.

All asphalt material and paving operations should meet applicable specifications of the Asphalt Institute and Florida Department of Transportation. A NOVA technician should observe placement and perform density testing of the SSC, base course material and asphalt.

Rigid Pavements

We understand that a rigid (concrete) pavement section may also be employed for the proposed pavement areas planned as part of this development. Recommended heavy duty and light duty pavement sections have been developed for this project based on our understanding of the existing subsurface conditions, review of applicable FDOT specifications, and the <u>assumed</u> pavement design parameters stated previously.

Our recommendations for slab thickness for standard duty and heavy-duty concrete pavements are also based on the subgrade soils being densified to a minimum soil density of at least 98 percent of the Modified Proctor test method (ASTM D-1557), and employment of a design modulus of subgrade reaction (k) equal to 150 pounds per cubic inch.

We recommend using the designs in Table 3 for Standard Duty and Heavy-Duty concrete (rigid) pavement sections.

Table 3 - Recommended Rigid Pavement Sections									
STANDARD DUTY PAVEMENT SECTION									
Minimum Pavement Thickness	Maximum Control Joint Spacing	Recommended Saw-Cut Depth							
5½ Inches	10 feet x 10 feet	1 ³ / ₈ Inches							
	HEAVY DUTY PAVEMENT SEC	CTION							
Minimum Pavement Thickness	Maximum Control Joint Spacing	Recommended Saw-Cut Depth							
8 Inches	12 feet x 12 feet	2 Inches							

All concrete materials and placement should conform to applicable FDOT specifications. We recommend that a non-woven geotextile (about 3 feet wide) be placed beneath the construction joints to prevent upward "pumping" movement of soil fines through the joints.

The recommend using concrete with a minimum compressive strength of 4,000 psi and a minimum 28-day flexural strength (modulus of rupture) of at least 600 pounds per square inch, based on 3^{rd} point loading of concrete beam test samples. All sections should be reinforced with #3 (3/8-in. diameter) rebar every 18-in OC. Layout of the sawcut control joints should form square panels, and the depth of sawcut joint should

be ¼ of the concrete slab thickness. The joints should be sawed within six hours of concrete placement or as soon as the concrete has developed sufficient strength to support workers and equipment.

We also recommend allowing NOVA to review and comment on the final concrete pavement design, including section and joint details (type of joints, joint spacing, etc.), prior to the start of construction. For further details on concrete pavement construction, please reference "Building Quality Concrete Parking Areas", published by the Portland Cement Association.

5.8 DRAINAGE CONSIDERATIONS

Soil strength and settlement potential is highly dependent upon the moisture condition of the supportive soil. Soil characteristics can change dramatically when moisture conditions change. As such, building pads, walkways, structures and surrounding grades should be properly designed and constructed to properly control water (surface and subsurface). Building pads should be designed to shed surface water prior to building construction. Grades surrounding structures should be adequately sloped away from the structure to promote positive drainage and prevent water from ponding near or against the structure. Swales and/or storm drainage structures should be constructed to collect and remove all surface water run-off. All roof drain downspouts should be connected to drain leaders that are properly daylighted or connected to storm drainage structures such that water is removed from structural areas. Interior and/or exterior foundation drains, if provided, should be installed to properly protect foundations from changing moisture conditions, including fluctuating shallow perched/laterally flowing subsurface water levels. All foundation drains, if provided, should be properly daylighted or connected to storm drain structures to remove all water from foundation areas. Roof drain lines and foundation drain lines should always remain independent of each other. Any subsurface water that may rise near structural grades should be controlled by adequately constructed subsurface drainage mechanisms.

6.0 LIMITATIONS

The findings, conclusions and recommendations presented in this report represent our professional opinions concerning subsurface conditions at the site. The opinions presented are relative to the dates of our site work and should not be relied on to represent conditions at significantly later dates or at locations not explored. The opinions included herein are based on information provided to us, the data obtained at specific locations during the study and our experience. If additional information becomes available that might impact our geotechnical opinions, it will be necessary for NOVA to review the information, reassess the potential concerns, and re-evaluate our conclusions and recommendations.

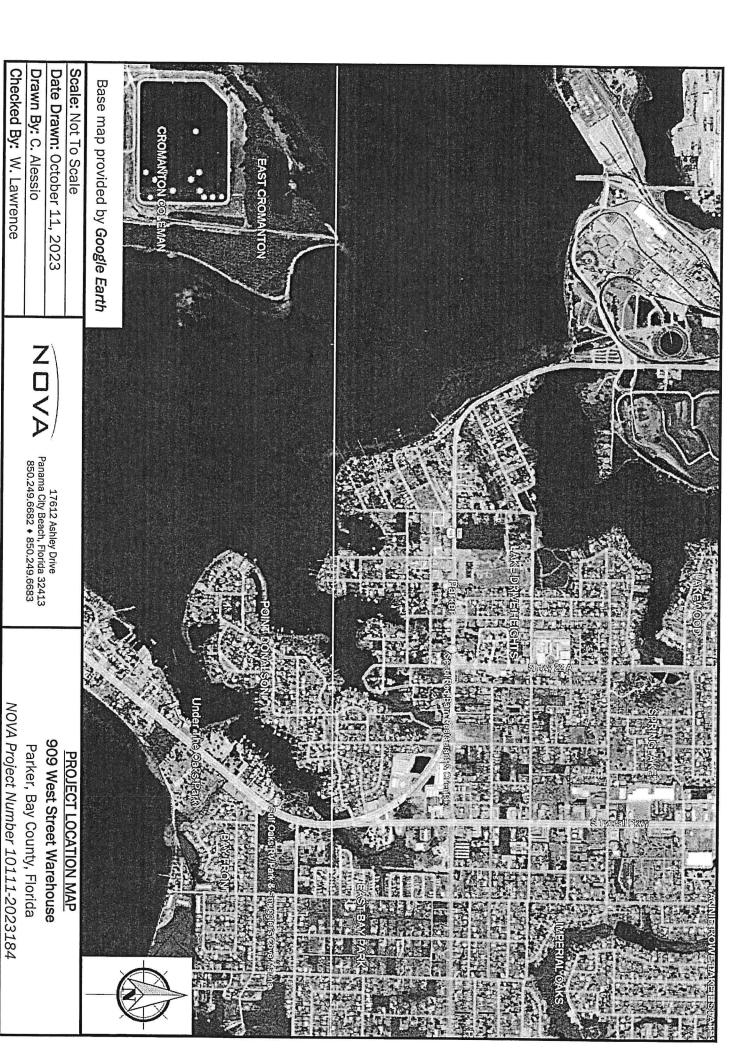

Regardless of the thoroughness of a geotechnical exploration, there is the possibility that conditions between test locations will differ from those encountered at specific test locations, that conditions are not as anticipated by the designers and/or the contractors, or that either natural events or the construction process have altered the subsurface conditions. These variations are an inherent risk associated with subsurface conditions in this region and the approximate methods used to obtain the data. These variations may not be apparent until construction.

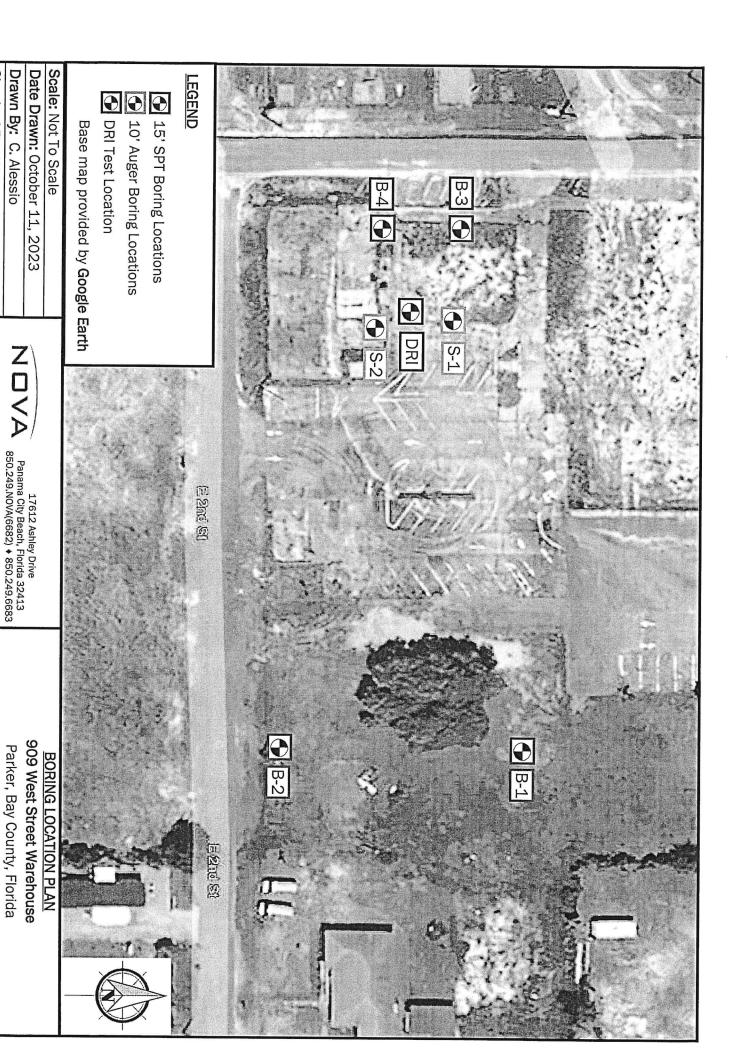

This report is intended for the sole use of **Northstar Engineering Services, LLC**. for the above noted project. The scope of work performed during this study may not satisfy other user's requirements. Use of this report or the findings, conclusions or recommendations by others will be at the sole risk of the user. NOVA is not responsible or liable for the interpretation by others of the data in this report, nor their conclusions, recommendations or opinions.

Our professional services have been performed, our findings obtained, our conclusions derived and our recommendations prepared in accordance with generally accepted geotechnical engineering principles and practices in the State of Florida. This warranty is in lieu of all other statements or warranties, either expressed or implied.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
9	Lakeland sand, 0 to 5 percent slopes	1.6	100.0%
Totals for Area of Interest		1.6	100.0%

Bay County, Florida

9-Lakeland sand, 0 to 5 percent slopes

Map Unit Setting

National map unit symbol: 2rz0n

Elevation: 100 to 400 feet

Mean annual precipitation: 40 to 69 inches Mean annual air temperature: 63 to 70 degrees F

Frost-free period: 190 to 310 days

Farmland classification: Not prime farmland

Map Unit Composition

Lakeland and similar soils: 80 percent

Minor components: 20 percent

Estimates are based on observations, descriptions, and transects of

the mapunit.

Description of Lakeland

Setting

Landform: Hills on marine terraces

Landform position (two-dimensional): Summit, shoulder

Landform position (three-dimensional): Interfluve

Down-slope shape: Convex Across-slope shape: Linear

Parent material: Sandy marine deposits

Typical profile

A - 0 to 7 inches: sand C - 7 to 80 inches: sand

Properties and qualities

Slope: 0 to 5 percent

Depth to restrictive feature: More than 80 inches

Drainage class: Excessively drained

Runoff class: Very low

Capacity of the most limiting layer to transmit water (Ksat): High to

very high (5.95 to 19.98 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None Frequency of ponding: None

Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0

mmhos/cm)

Available water supply, 0 to 60 inches: Low (about 3.1 inches)

Interpretive groups

Land capability classification (irrigated): 4s

Land capability classification (nonirrigated): 3s

Hydrologic Soil Group: A

Other vegetative classification: Longleaf Pine-Turkey Oak Hills

(R133AY002FL)

Hydric soil rating: No

Minor Components

Troup

Percent of map unit: 6 percent Landform: Ridges, knolls

Landform position (two-dimensional): Summit Landform position (three-dimensional): Interfluve

Down-slope shape: Convex Across-slope shape: Linear

Other vegetative classification: Sandy soils on ridges and dunes of

xeric uplands (G133AA111FL)

Hydric soil rating: No

Bonifay

Percent of map unit: 5 percent Landform: Hills on marine terraces

Landform position (two-dimensional): Summit Landform position (three-dimensional): Interfluve

Down-slope shape: Linear, convex Across-slope shape: Convex, linear

Other vegetative classification: Sandy soils on rises, knolls, and ridges of mesic uplands (G133AA121FL), Longleaf Pine-Turkey

Oak Hills (R133AY002FL)

Hydric soil rating: No

Foxworth

Percent of map unit: 5 percent

Landform: Ridges on marine terraces

KEY TO BORING LOGS

SYMBOLS AND ABBREVIATIONS

S	MBOLS AND ABBREVIATIONS
SYMBOL	DESCRIPTION
	No. of Blows of a 140-lb. Weight Falling 30
N-Value	Inches Required to Drive a Standard Spoon 1 Foot
WOR	Weight of Drill Rods
WOH	Weight of Drill Rods and Hammer
	Sample from Auger Cuttings
	Standard Penetration Test Sample
	Thin-wall Shelby Tube Sample (Undisturbed Sampler Used)
% REC	Percent Core Recovery from Rock Core Drilling
RQD	Rock Quality Designation
lacksquare	Stabilized Groundwater Level
\mathbf{V}	Seasonal High Groundwater Level (also referred to as the W.S.W.T.)
NE	Not Encountered
GNE	Groundwater Not Encountered
BT	Boring Terminated
-200 (%)	Fines Content or % Passing No. 200 Sieve
MC (%)	Moisture Content
LL	Liquid Limit (Atterberg Limits Test)
PI	Plasticity Index (Atterberg Limits Test)
K	Coefficient of Permeability
Org. Cont.	Organic Content
G.S. Elevation	Ground Surface Elevation

UNIFIED SOIL CLASSIFICATION SYSTEM

	MAJOR DIVI	sions	GROUP SYMBOLS	TYPICAL NAMES
**************************************	GRAVELS	CLEAN	GW	Well-graded gravels and gravel- sand mixtures, little or no fines

*Based on the material passing the 3-inch (75 mm) sieve

** Use dual symbol (such as SP-SM and SP-SC) for soils with more than 5% but less than 12% passing the No. 200 sieve

RELATIVE DENSITY

(Sands and Gravels)
Very loose – Less than 4 Blow/Foot
Loose – 4 to 10 Blows/Foot
Medium Dense – 11 to 30 Blows/Foot
Dense – 31 to 50 Blows/Foot
Very Dense – More than 50 Blows/Foot

CONSISTENCY

(Silts and Clays)
Very Soft – Less than 2 Blows/Foot
Soft – 2 to 4 Blows/Foot
Medium Stiff – 5 to 8 Blows/Foot
Stiff – 9 to 15 Blows/Foot
Very Stiff – 16 to 30 Blows/Foot
Hard – More than 30 Blows/Foot

RELATIVE HARDNESS

(Limestone)
Soft – 100 Blows for more than 2 Inches
Hard – 100 Blows for less than 2 Inches

MODIFIERS

These modifiers Provide Our Estimate of the Amount of Minor Constituents (Silt or Clay Size Particles) in the Soil Sample

Trace – 5% or less

With Silt or With Clay - 6% to 11% Silty or Clayey - 12% to 30% Very Silty or Very Clayey - 31% to 50%

These Modifiers Provide Our Estimate of the Amount of Organic Components in the Soil Sample

Trace - Less than 3% Few - 3% to 4% Some - 5% to 8% Many - Greater than 8%

These Modifiers Provide Our Estimate of the Amount of Other Components (Shell, Gravel, Etc.) in the Soil Sample

Trace - 5% or less Few - 6% to 12% Some - 13% to 30% Many - 31% to 50%

APPENDIX D Support Documents

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

Geotechnical Services Are Performed for Specific Purposes, Persons, and Projects

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical-engineering study conducted for a civil engineer may not fulfill the needs of a constructor — a construction contractor — or even another civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared solely for the client. No one except you should rely on this geotechnical-engineering report without first conferring with the geotechnical engineer who prepared it. And no one — not even you — should apply this report for any purpose or project except the one originally contemplated.

Read the Full Report

Serious problems have occurred because those relying on a geotechnical-engineering report did not read it all. Do not rely on an executive summary. Do not read selected elements only.

Geotechnical Engineers Base Each Report on a Unique Set of Project-Specific Factors

Geotechnical engineers consider many unique, project-specific factors when establishing the scope of a study. Typical factors include: the client's goals, objectives, and risk-management preferences; the general nature of the structure involved, its size, and configuration; the location of the structure on the site; and other planned or existing site improvements, such as access roads, parking lots, and underground utilities. Unless the geotechnical engineer who conducted the study specifically indicates otherwise, do not rely on a geotechnical-engineering report that was:

- not prepared for you;
- not prepared for your project;
- not prepared for the specific site explored; or
- completed before important project changes were made.

Typical changes that can erode the reliability of an existing geotechnical-engineering report include those that affect:

- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a lightindustrial plant to a refrigerated warehouse;
- the elevation, configuration, location, orientation, or weight of the proposed structure;
- · the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes—even minor ones—and request an

assessment of their impact. Geotechnical engineers cannot accept responsibility or liability for problems that occur because their reports do not consider developments of which they were not informed.

Subsurface Conditions Can Change

A geotechnical-engineering report is based on conditions that existed at the time the geotechnical engineer performed the study. Do not rely on a geotechnical-engineering report whose adequacy may have been affected by: the passage of time; man-made events, such as construction on or adjacent to the site; or natural events, such as floods, droughts, earthquakes, or groundwater fluctuations. Contact the geotechnical engineer before applying this report to determine if it is still reliable. A minor amount of additional testing or analysis could prevent major problems.

Most Geotechnical Findings Are Professional Opinions

Site exploration identifies subsurface conditions only at those points where subsurface tests are conducted or samples are taken. Geotechnical engineers review field and laboratory data and then apply their professional judgment to render an opinion about subsurface conditions throughout the site. Actual subsurface conditions may differ — sometimes significantly — from those indicated in your report. Retaining the geotechnical engineer who developed your report to provide geotechnical-construction observation is the most effective method of managing the risks associated with unanticipated conditions.

A Report's Recommendations Are Not Final

Do not overrely on the confirmation-dependent recommendations included in your report. Confirmation-dependent recommendations are not final, because geotechnical engineers develop them principally from judgment and opinion. Geotechnical engineers can finalize their recommendations only by observing actual subsurface conditions revealed during construction. The geotechnical engineer who developed your report cannot assume responsibility or liability for the report's confirmation-dependent recommendations if that engineer does not perform the geotechnical-construction observation required to confirm the recommendations' applicability.

A Geotechnical-Engineering Report Is Subject to Misinterpretation

Other design-team members' misinterpretation of geotechnical-engineering reports has resulted in costly

problems. Confront that risk by having your geotechnical engineer confer with appropriate members of the design team after submitting the report. Also retain your geotechnical engineer to review pertinent elements of the design team's plans and specifications. Constructors can also misinterpret a geotechnical-engineering report. Confront that risk by having your geotechnical engineer participate in prebid and preconstruction conferences, and by providing geotechnical construction observation.

Do Not Redraw the Engineer's Logs

Geotechnical engineers prepare final boring and testing logs based upon their interpretation of field logs and laboratory data. To prevent errors or omissions, the logs included in a geotechnical-engineering report should *never* be redrawn for inclusion in architectural or other design drawings. Only photographic or electronic reproduction is acceptable, but recognize that separating logs from the report can elevate risk.

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can make constructors liable for unanticipated subsurface conditions by limiting what they provide for bid preparation. To help prevent costly problems, give constructors the complete geotechnical-engineering report, but preface it with a clearly written letter of transmittal. In that letter, advise constructors that the report was not prepared for purposes of bid development and that the report's accuracy is limited; encourage them to confer with the geotechnical engineer who prepared the report (a modest fee may be required) and/ or to conduct additional study to obtain the specific types of information they need or prefer. A prebid conference can also be valuable. Be sure constructors have sufficient time to perform additional study. Only then might you be in a position to give constructors the best information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions.

Read Responsibility Provisions Closely

Some clients, design professionals, and constructors fail to recognize that geotechnical engineering is far less exact than other engineering disciplines. This lack of understanding has created unrealistic expectations that have led to disappointments, claims, and disputes. To help reduce the risk of such outcomes, geotechnical engineers commonly include a variety of explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help

others recognize their own responsibilities and risks. *Read these provisions closely*. Ask questions. Your geotechnical engineer should respond fully and frankly.

Environmental Concerns Are Not Covered

The equipment, techniques, and personnel used to perform an *environmental* study differ significantly from those used to perform a *geotechnical* study. For that reason, a geotechnical-engineering report does not usually relate any environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated environmental problems have led to numerous project failures*. If you have not yet obtained your own environmental information, ask your geotechnical consultant for risk-management guidance. *Do not rely on an environmental report prepared for someone else*.

Obtain Professional Assistance To Deal with Mold

Diverse strategies can be applied during building design, construction, operation, and maintenance to prevent significant amounts of mold from growing on indoor surfaces. To be effective, all such strategies should be devised for the express purpose of mold prevention, integrated into a comprehensive plan, and executed with diligent oversight by a professional mold-prevention consultant. Because just a small amount of water or moisture can lead to the development of severe mold infestations, many mold- prevention strategies focus on keeping building surfaces dry. While groundwater, water infiltration, and similar issues may have been addressed as part of the geotechnical- engineering study whose findings are conveyed in this report, the geotechnical engineer in charge of this project is not a mold prevention consultant; none of the services performed in connection with the geotechnical engineer's study were designed or conducted for the purpose of mold prevention. Proper implementation of the recommendations conveyed in this report will not of itself be sufficient to prevent mold from growing in or on the structure involved.

Rely, on Your GBC-Member Geotechnical Engineer for Additional Assistance

Membership in the Geotechnical Business Council of the Geoprofessional Business Association exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project. Confer with you GBC-Member geotechnical engineer for more information.

8811 Colesville Road/Suite G106, Silver Spring, MD 20910 Telephone: 301/565-2733 Facsimile: 301/589-2017 e-mail: info@geoprofessional.org www.geoprofessional.org

OF CINETE

EASEMENT

This EASEMENT ("Easement") is made and entered into as of this day of March, 2024, by and between COASTAL ACQUISITIONS OF FLORIDA, LLC, a Florida limited liability company ("Grantor"), in favor of the CITY OF PARKER, FLORIDA, a municipal corporation organized and existing under the laws of the State of Florida ("Grantee").

In consideration of the covenants set forth herein, the sum of Ten and No/100 Dollars (\$10.00) and other good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, the parties agree as follows:

- 1. Grant of Easement. Grantor does hereby grant, convey, bargain and sell unto Grantee a non-exclusive easement over, under, upon, through, across and onto that certain real property located in Bay County, Florida, more particularly described on Exhibit "A", attached hereto and incorporated herein ("Property"), for the purposes expressed herein.
- 2. Purpose of Easement. The purpose of the Easement is the use by Grantee and the public in general of the stormwater system on the Property, water and sewer lines or other related facilities approved by Grantee as a part of the development of the Property (collectively "Facilities") and structures related to the Facilities and rights of Grantee to ingress and egress over, across and through the Property. Grantor acknowledges that the Facilities

may be used as a part of a larger stormwater system throughout the City of Parker, Florida, and that stormwater from other properties may flow onto the Property and be conveyed or treated by the Facilities.

- 3. <u>Maintenance of Facilities</u>. Grantor or Grantor's successors and assigns shall maintain the Property and the Facilities including but not limited to installing, constructing, repairing and maintaining the Facilities to the satisfaction of Grantee.
- 4. <u>Commencement</u>. This Easement shall be perpetual commencing on the date of execution of this Easement.
- 5. Reservation of Rights. Grantor reserves and retains all rights in the Property not specifically granted herein, including, but not limited to, the right to use the Property for any and all purposes not inconsistent with the exercise by Grantee of the privileges granted herein.
- 6. <u>Non-Interference</u>. Grantor shall not obstruct the use of the Property or interfere with the lawful use thereof by Grantee and/or Grantee's guests, invitees, licensees, agents, employees, contractors, heirs, successors and assigns.
- 7. <u>Title</u>. Grantor covenants to Grantee and Grantee's successors and assigns that Grantor is the fee simple owner of the Property and the Development and the Property and the Development is free from all liens and encumbrances whatsoever, except ad

Stormwater Management Report All Metal Roofing and Siding Parker, Florida

Project Number: FL0016-22

Project Title:

All Metal Roofing and Siding

909 West Street

Parker, Florida 32404

Bay County

Storm Calculation Summary

The proposed All Metal Roofing and Siding project and contributing area were analyzed to determine the pre-development and post-development storm runoff rates for the 100year critical storm event, as well as storage volumes and recovery times. The calculations include the 1 hour, 2-hour, 4-hour, 8 hour, and 24-hour durations. The calculations also include pre-development and post-development storm runoff rates for the 25-year 1-hour, 2-hour, 4-hour, 8-hour, and 24-hour storm events. PondPackV8i and the design parameters in the Bay County Land Development Regulations and the Florida Department of Environmental Protection and Northwest Florida Water Management District's Environmental Resource Permit Applicant's Handbook, Volume II were used to perform the calculations. The results of the calculations are summarized as follows:

Pre-Development:

The pre-development site and contributing area consists of one (1) subarea. This is named "Pre Development Area". Its properties are as follows:

"Pre Development Area" is area that flows to the southwest corner of the property. It consists of 2.88 acres with a curve number of 74.1 (35/157). Its time of concentration is 5 minutes (28/157). The pre-development peak flows to the outfall ("Pre Outfall") are 11.24 cfs, 10.93 cfs, 6.04 cfs, 7.31 cfs, and 2.31 cfs for the 1-hour, 2-hour, 4-hour, 8hour, and 24-hour durations of the 25-year storm event, respectively and 15.72 cfs, 15.39 cfs, 8.39 cfs, 9.77 cfs, and 3.38 cfs for the 1-hour, 2-hour, 4-hour, 8-hour, and 24-hour durations of the 100-year storm event, respectively. (3/157).

Post-Development:

The proposed site and contributing area consists of three (3) subareas. These are "Post to West", "Post to South", and "Post Outfall". Their properties are as follows:

"Post to West" is area that will be detained within the proposed dry detention pond ("Western Pond"). It will consist of 1.212 acres with a curve number of 70.5 (34/157). Its time of concentration is to be 5.0 minutes (minimum).

"Post to South" is area that will be detained within the proposed dry detention pond ("Southern Pond"). It will consist of 0.364 acres with a curve number of 85.4 (33/157). Its time of concentration is to be 5.0 minutes (minimum).

"Post Outfall" is area that will not reach a detention system and is to be released directly to the outfall ("Post Outfall"). It will consist of 1.308 acres with a curve number of 43.0 (32/157). Its time of concentration is to be 5.0 minutes (18/157). The post-development peak flows to the outfall are to be 0.42 cfs, 0.49 cfs, 0.79 cfs, 1.17 cfs, and 0.42 cfs for the 1-hour, 2-hour, 4-hour, 8-hour, and 24-hour durations of the 25-year storm event, respectively and 1.11 cfs, 1.49 cfs, 1.41 cfs, 2.01 cfs, and 0.77 cfs for the 1-hour, 2-hour, 4-hour, 8-hour, and 24-hour durations of the 100-year storm event (2/157).

The post-development peak flows to the outfall ("Post Outfall") are to be 2.65 cfs, 2.98 cfs, 2.99 cfs, 4.25 cfs, and 0.90 cfs for the 1-hour, 2-hour, 4-hour, 8-hour, and 24-hour durations of the 25-year storm event, respectively and 6.80 cfs, 8.16 cfs, 4.65 cfs, 6.41 cfs, and 1.66 cfs for the 1-hour, 2-hour, 4-hour, 8-hour, and 24-hour durations of the 100-year storm event (3/157).

The greatest post development discharge to the "Post Outfall" outfall occurs during the 2-hour, 100-year storm event. Therefore, the 2-hour, 100-year storm event is the critical storm event for this outfall.

Post-Development Detention:

The proposed site and contributing area will contain two (2) dry detention ponds. These are "Western Pond" and "Southern Pond". Their properties are as follows:

"Western Pond" will provide 0.081 ac-ft of storage volume between the elevations of 18.00 and 20.00 (120/157). The maximum stormwater elevation reached in the pond is to be 19.95, which occurs during the 2-hour, 100-year storm (4/157), thereby being contained within the proposed dry detention system. The infiltration rate of 15.4 in/hr with a factor of safety of 2.0 (equaling 7.7 in/hr) was used in the design of this dry detention system. A weir (Outlet-1) was modeled as an outlet device in the western edge of the pond with an elevation of 19.75 (123/157) to prevent over-topping in the event of severe flooding. The required maximum treatment height for this pond is 19.68', therefore the required treatment volume is reached before any outflow occurs.

"Southern Pond" will provide 0.062 ac-ft of storage volume between the elevations of 19.33 and 21.75 (118/157). The maximum stormwater elevation reached in the pond is to be 21.64, which occurs during the 2-hour, 100-year storm (4/157), thereby being contained within the proposed dry detention system. The infiltration rate of 15.4 in/hr with a factor of safety of 2.0 (equaling 7.7 in/hr) was used in the design of this dry detention system. A weir (Outlet-2) was modeled as an outlet device in the south edge of

the pond with an elevation of 21.50 (127/157) to prevent over-topping in the event of severe flooding. The required maximum treatment height for this pond is 20.81', therefore the required treatment volume is reached before any outflow occurs.

Conclusion:

The results show that the routed peak flows for the developed site are less than or equal to the peak flows for the pre-developed site for the critical storm events with the critical storm events being controlled within the detention systems. The results also show that the routed peak flows for the developed site are less than or equal to the peak flows for the pre-developed site for all 25-year and 100-year storm events, thus they are being controlled within the detention systems.

The attached detailed report includes:

- Required treatment volume calculations
- Recovery time calculations
- PondPack Stormwater report

Please let me know if you have any questions or need any additional information.

Sincerely,

Phillip E. Santora, P.E. Northstar Engineering Services, Inc.

REQUIRED TREATMENT VOLUME CALCULATION & RECOVERY TIME CALCULATIONS

Dry Detention System "Western Pond"

Contributing Area = 1.212 Acres

Required Treatment Volume Calculations:

Impervious Area = 0.626 ac. (0.95)Gravel Area = 0.034 (0.85)Grassed/Landscaped Areas = 0.553 ac. (0.25)

Runoff Coefficient = $\frac{(0.626 \ ac.*0.95) + (0.034*0.85) + (0.553 \ ac.*0.25)}{(0.553 \ ac.*0.25)} = 0.63$

Treatment Volume (1 in x Runoff Coefficeint) = $\frac{0.63(1.212 \text{ ac})(1 \text{ in})(43,560 \text{ ft}^2/\text{ac})}{12 \text{in}/\text{ft}} = 2771.72 \text{ ft}^3$

Treatment Volume (0.5 in) = $\frac{0.50 (1.212 \text{ ac.})(1 \text{ in})(43560 \frac{ft^2}{ac})}{12 \text{ in}/ft} = 2199.78 \text{ ft}^3$

 $2771.72 ft^3 > 2199.78 ft^3$

Treatment Volume Required = $2771.72 \text{ } \text{ft}^3 = 0.064 \text{ ac. ft.}$

	"Western Pond" Stage Storage	
Elevation	Area (ac)	Volume (Total)(ac.ft)
18.00	0.019	0.000
19.00	0.039	0.028
20.00	0.068	0.081

Height of Treatment Volume in Pond (between elevations 19.00 and 20.00):
$$= 19.00 + (20.00 - 19.00) \left[\frac{(0.064 \ ac.ft - 0.028 \ ac.ft)}{(0.081 \ ac.ft - 0.028 \ ac.ft)} \right] = 19.68$$

Required Recovery Time Calculations

Depth to Drawdown = 19.68 - 18.00 = 1.68 ft * 1 ft / 12 in = 20.16 in

Design Infiltration Rate = 7.7 in/hr

Recovery Time = $\frac{20.16 \text{ in}}{7.7 \frac{\ln n}{hr}}$ = 2.62 hrs (< 72 hrs)

Dry Detention System "Southern Pond"

Contributing Area = 0.364 Acres

Required Treatment Volume Calculations:

Impervious Area = 0.286 ac. (0.95)Grassed/Landscaped Areas = 0.078 ac. (0.25)

Runoff Coefficient =
$$\frac{(0.286 \text{ ac.*}0.95) + (0.078 \text{ ac.*}0.25)}{0.364 \text{ ac.}} = 0.80$$

Treatment Volume (1 in x Runoff Coefficeint) = $\frac{0.80(0.364 \, ac)(1 \, in)(43,560 ft^2/ac)}{12 in/ft} = 1057.06 \, ft^3$

Treatment Volume (0.5 in) =
$$\frac{0.50 (0.364 \text{ ac.})(1 \text{ in})(43560 \frac{ft^2}{ac})}{12 \text{ in/ft}} = 660.66 \text{ ft}^3$$

 $1057.06\,ft^3\,>660.66\,ft^3$

Treatment Volume Required = $1,057.06 ft^3 = 0.024 ac. ft.$

	"Southern Pond" Stage Storage	
Elevation	Area (ac)	Volume (Total)(ac.ft)
19.33	0.000	0.000
20.00	0.015	0.003
21.00	0.038	0.029
21.75	0.050	0.062

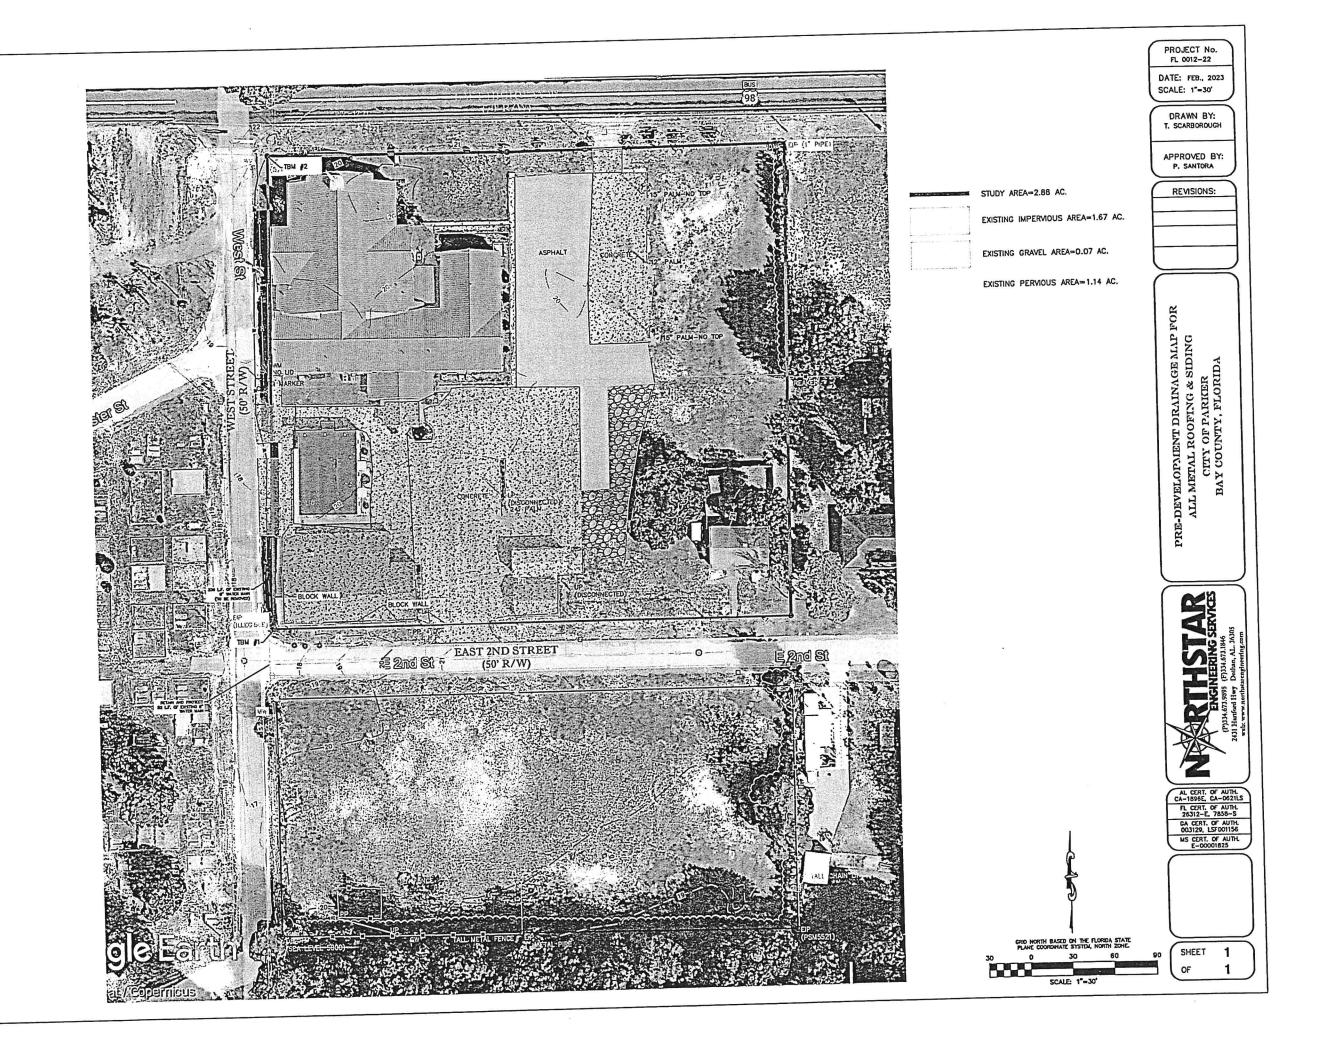

Height of Treatment Volume in Pond (between elevations 28.00 and 29.00):
$$= 20.00 + (21.00 - 20.00) \left[\frac{(0.024 \ ac.ft - 0.003 \ ac.ft)}{(0.029 \ ac.ft - 0.003 \ ac.ft)} \right] = 20.81$$

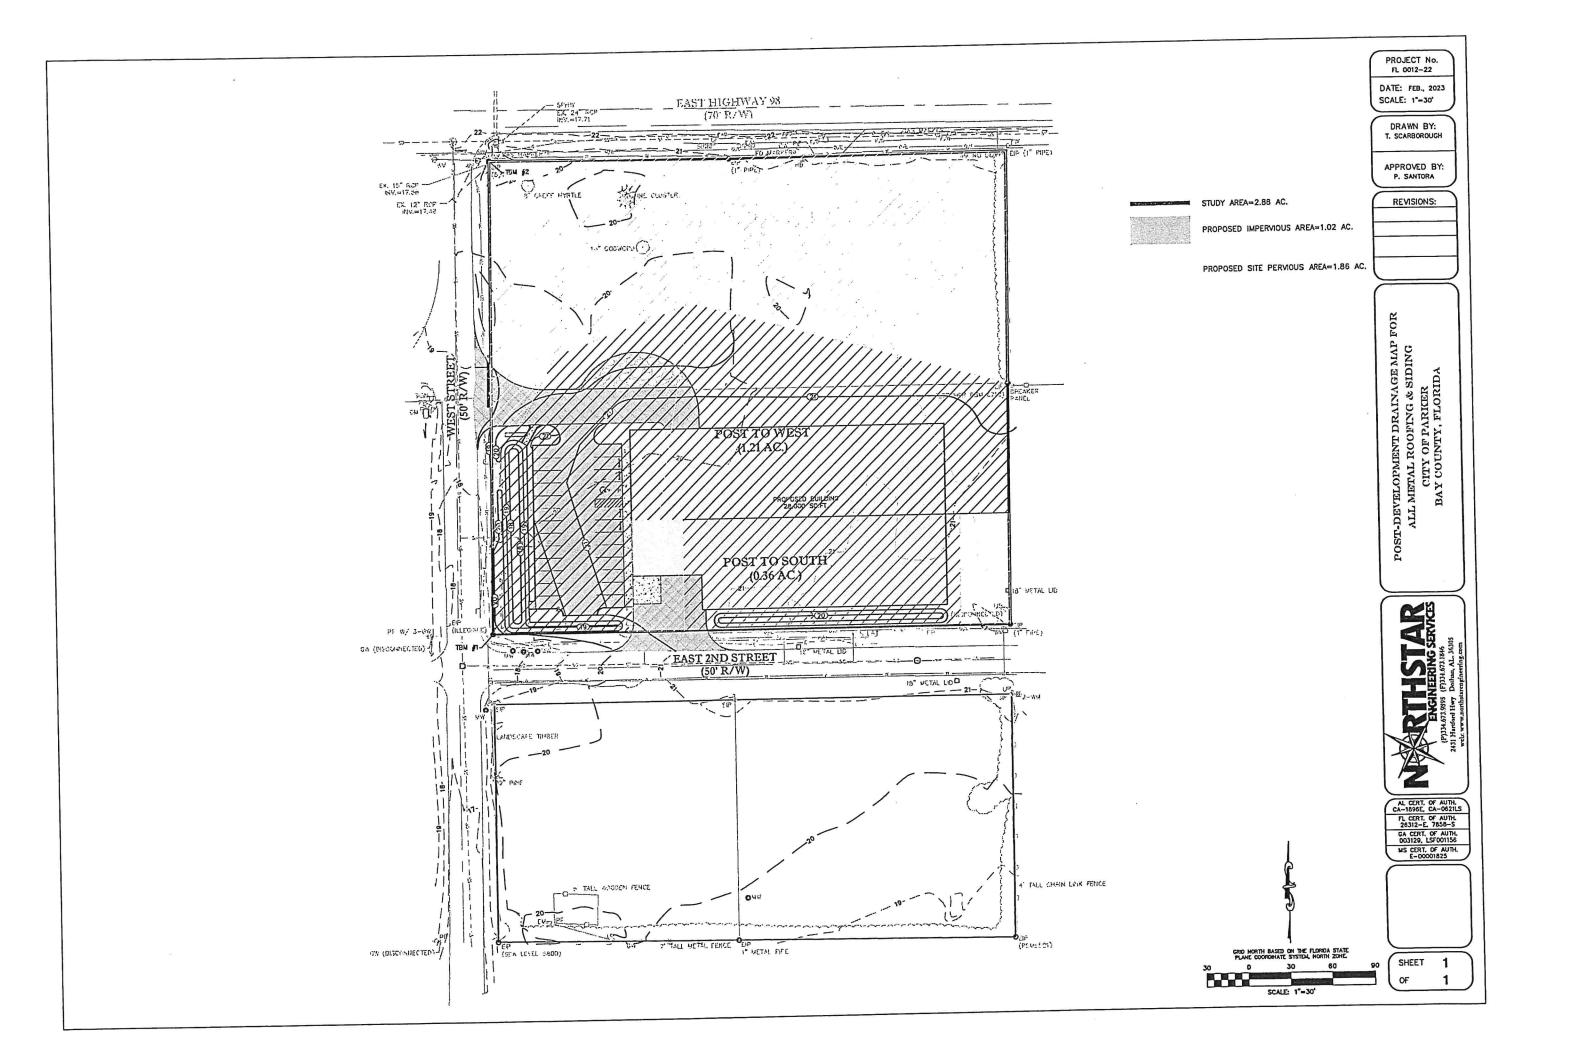

Required Recovery Time Calculations

Depth to Drawdown = 20.96 - 20.00 = 0.81 ft * 1 ft / 12 in = 9.72 in

Design Infiltration Rate = 7.7 in/hr

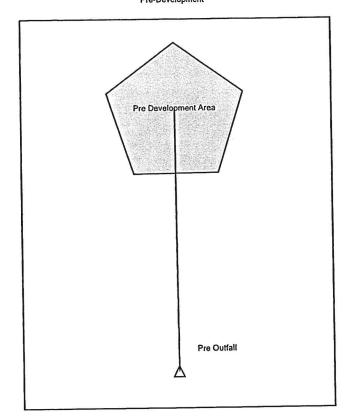

Recovery Time =
$$\frac{9.72 \text{ in}}{7.7 \frac{\ln}{h_{\text{r}}}}$$
 = 1.26 hrs (< 72 hrs)

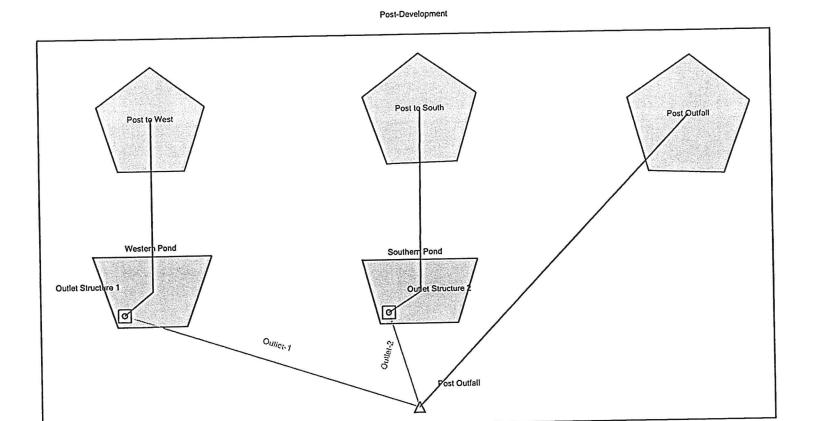

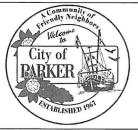

Scenario: 100 year (2 hour)

Pre-Development
